[7] Notes

1. Max three (3) times reflow is allowed.
I hope the gauntlet ahead in 5s or less from +350 °C or less in case of the adjustment with the soldering iron.
2. Too much exciting shock or vibration may cause deterioration on damage. Depending on the condition such as a shock in assembly machinery, the products may be damaged.
Please check your condition in advance to maintain shock level to be smallest.
3. The shortest line patterning on board is recommendable.
Too long line on board may cause of abnormal oscillation.
4. Please normal temperature (+15 °C to +35 °C) and normal humidity (25 to 85 %RH) as much as possible for the frequency accuracy securing.
Storing the crystal products under higher or lower temperature or high humidity for long period may affect frequency stability or solderability. Check conditions prior to use.
5. This product may be affected to ultrasonic cleaning. Check conditions prior to use.
6. When do the be dewy of the oscillation circuit board, the frequency change or the oscillation stop is generated. Please use it under the condition without the be dewy.
7. Applying excessive excitation force to the crystal unit may cause deterioration damage.
8. Few data or readings taken at user side may be different from our company's data.
Confirmation of the different value is necessary before application.
9. To avoid malfunction, no pattern under or near the crystal is allowed.
10. Unless adequate negative resistance is allocated in the oscillation circuit, start up time of oscillation may be increased, or no oscillation may occur. In order to avoid this, please provide enough negative resistance in the circuit design.

<How to check the negative resistance>

1) Connect the resistor(R) to the circuit in series with the crystal unit.

2) Adjust R so that oscillation can start (or stop).

Negative resistance of circuit (-R) =
R+ Series resistance of crystal (R1)

3) Measure R when oscillation just start (or stop) in above(2)

R > R1 Max. 5 to 10 times.
